

HD - TC Seam Detection Sensor will be your eye!
HDTC Seam Detection Sensor will be your eye!

With the newly developed Sewing Detection feature in

DURMA HD - TC machines, your workload is further reduced.

- The Seam Detection sensor attached to the HD - TC machines detects the stitched surface when the pipe is loaded on the machine and provides the ability to rotate the operator's cut holes at any angle.

- In existing HD - TC machines, the cutting operation is performed automatically regardless of the seam surface of the pipe side profile coming from the loading unit.

The newly developed Seam Detection feature detects the seam surface of the pipe which will be cut before the machine is cut; the operator can visually repair the parts by changing the angle of the internal contours which will be cut off depending on the wishes of the operator.

Features

- Less operator job
- Reduced error possibility
- The best result as soon as possible
- Increased quality for visual parts
