

Qualified Parts with Spatter Protection! Qualified Parts with Spatter Protection!

DURMA improved Spatter Protection for HD-TC Machines

- The Spatter Protection system is used to prevent the slag coming out at the cutting edge from sticking to the opposite surface of the profile. The burrs adhering to the inner surface of the profile disrupt both the cutting quality and cause some cleaning of the inner surface of the work pieces. All these problems can be prevented by Spatter Protection system.
- At the end of the system there is a piece called the spoon, during cutting this part is placed in the pipe or profile and the slag is formed in the spoon without sticking to the other surface.

Advantages

Disabled Spatter Protection

Enabled Spatter Protection

With spatter protection system;

- The users can cut more qualified parts,
- The operator doesn't need 2nd operation to clean slugs,
- Productivity increases,
- Less operation job.
